State elections: Eyes peeled for AfD’s scoring, little impact on federal race

- Next Sunday’s regional election in the small eastern German state Saxony-Anhalt is the last electoral test in the run-up to the federal election in September. Polls suggest that the CDU will remain the strongest political force, despite being challenged by the right-wing AfD. The Conservatives will likely form another three-party government (without the AfD, that is).
- Even a narrow win would be a positive for the CDU’s federal campaign. Whereas an AfD victory - though lacking coalition partners to form a government - would be a (non-lethal) blow for Laschet’s election campaign.
- The federal election campaign is just heating up. The electorate seems a little disenchanted with Greens and their chancellor candidate, allowing the Conservatives to regain the lead in the neck-and-neck race in the polls. Still, the two parties are polling too close to speak of a turning point (yet).

CDU challenged by right-wing AfD. The upcoming regional election in tiny Saxony-Anhalt (some 1.8m voters, 3% of overall German voters) is seen as the last electoral test before the federal election on September 26. Admittedly, regional elections, in particular in the eastern German states, have their own dynamics, with Saxony-Anhalt having a somewhat politically disenchanted electorate, leading to rather low electoral participation. This might be explained by the region’s comparatively weak economic performance now amplified by the pandemic, high emigration of younger people, an aging population and the exit from coal mining. Nevertheless, the regional election is getting attention in particular for the role of the AfD: The CDU is defending its position as the strongest party against the right-wing AfD (see Figure 1). In 2016, running for the first time in Saxony-Anhalt, the AfD won 24.3% of votes, becoming the second-largest parliamentary group (the AfD later made similar inroads in other east German state parliaments, see Figure 2). Latest polls see the CDU ahead of the AfD, though. The Conservatives can count on their rather popular PM, Haseloff, who has been in office since 2011. But the Conservatives’ weaker standing overall and the infighting about the nomination of the CDU/CSU chancellor candidate might have disappointed some voters, pushing them into the camp of the non-voters or other parties. More than 45% of voters are still undecided whether to vote or who to vote for (Politbarometer). The Greens gained ground, potentially doubling their share of voters to 10%. Still, eastern Germany is tough terrain for the Greens and a low double-digit figure is way below the party’s national polling average. The FDP will probably be among the winners, too, as polls suggest that it will pass the 5%-threshold and re-enter parliament after 10 years. For the SPD, it is a matter of stabilizing the voter share at a historically low 10%. The Left is threatened by an electoral defeat, risking the loss of about one third of voters, standing at about 10%.
Another CDU-led government on the horizon. In the last two decades, Saxony-Anhalt has been ruled by almost any possible coalition. Since 2016, a so-called “Kenia coalition” of CDU-SPD-Greens has been in office. Even though the coalition is marked by tensions between the Conservatives and the Greens, chances for a continuation are high. The strong performance of the AfD forces parties to find “creative” solutions, as all have ruled out any collaboration with the AfD. However, coalitions with left-leaning parties (as the Greens are perceived) are not very popular among the very conservative CDU in Saxony-Anhalt, leading to tensions within the party. Thus, it decided that this time coalition agreements need the approval of the party base. The party base favors a coalition without the disliked Greens, i.e., a “Germany coalition” between CDU, SPD and FDP. This would also be the voters’ preferred coalition option, while a continuation of the Kenia-coalition is rejected by nearly half of the voters (Politbarometer). However, it remains to be seen whether this alliance will achieve a majority and whether the SPD would be prepared to change the coalition partner. Polls suggest a close race. The same applies for a CDU-Green-FDP “Jamaica” coalition – a defeat for the SPD that would be sent into opposition. In the rather unlikely event of the AfD coming in first, probably a four-party coalition between CDU, SPD, Greens and FDP would be formed. In any case, the incumbent PM already indicated that picking the coalition partners and agreeing on a political agenda for the next 5 years might well take until after the federal elections in September. Although some of the CDU’s base in Saxony-Anhalt are open to a more flexible approach to the AfD, this has been ruled out by the local leaders and – just this week – by Armin Laschet, the CDU chancellor candidate.

Limited impact on the federal level. State election outcomes can have severe repercussions on the federal level. The situation in Saxony-Anhalt brings to mind the 2019 elections in Thuringia when the distribution of seats and especially a strong AfD severely complicated the forming of a new government. The AfD’s coup to support the CDU and FDP in electing a PM ultimately served as the trigger for Annegret Kramp-Karrenbauer’s demission as the CDU party leader. Times are different now, though, with the federal election just around the corner. An AfD victory would of course create disturbing political noise for the CDU’s election campaign, and dominate talk-shows and opinion pieces for weeks. But we deem any speculation that this would weaken Laschet to the extent that Söder could take over as candidate for chancellorship as unrealistic. To support the regional CDU, Laschet visited Saxony-Anhalt this weekend. He motivated citizens to participate in the elections and warned against a strong AfD, saying that this could lead to a “rude awakening” (Spiegel, May 29). Presumably, Laschet prefers to avoid another difficult debate about the CDU’s relationship with the AfD – which, however, is more a topic in eastern Germany than at the federal level. Here, the AfD is not nearly as strong as in the eastern states and scores around 10%.

Federal election: CDU/CSU manages to regain a small lead in the tight race with the Greens. On the federal level, the election campaign is just heating up. Frequent public appearances of the parties’ frontrunners have intensified insights into and discussion of specific political positions. Lately, this has not been to the advantage of the Greens. Their chancellor candidate Baerbock had to explain herself for retrospectively declaring allowances she received from the Greens as their party leader. In addition, the party got entangled in a discussion on the delivery of defensive weapons to Ukraine. Both are tricky issues for a party, having pacifist roots and calling for transparency. In the polls, this resulted in the CDU/CSU (25.1%, see Figure 4) regaining the lead in the neck-and-neck race with the Greens (22.6%). However, the lead remains within the statistical error range. It is therefore too early
to speak of a burst of the Greens’ (media) bubble. Still, the disappointment over the Conservatives seems to be subsiding a bit, for example, reflected in 56% of voters preferring a CDU/CDU-led government (+6pp since the beginning of May, Politbarometer May 21). A Green-led government is favoured by 38% of voters (-1pp). However, also the FDP (12.7%) continues to gain in the polls, probably a reflection of its constructive criticism of the government’s pandemic management. The SPD remains tacked at the 15% mark and the Left moves slowly and dangerously close to the 5% threshold. All in all, we feel more comfortable with our baseline call of a black-green government.

We thank Ursula Walther for her valuable contribution.

Details regarding our organizational arrangements and information barriers we have to prevent and avoid conflicts of interest with respect to our research are available on our website (https://research.db.com/Research/) under Disclaimer.

Macroeconomic fluctuations often account for most of the risks associated with exposures to instruments that promise to pay fixed or variable interest rates. For an investor who is long fixed-rate instruments (thus receiving these cash flows), increases in interest rates naturally lift the discount factors applied to the expected cash flows and thus cause a loss. The longer the maturity of a certain cash flow and the higher the move in the discount factor, the higher will be the loss. Upside surprises in inflation, fiscal funding needs, and FX depreciation rates are among the most common adverse macroeconomic shocks to receivers. But counterparty exposure, issuer creditworthiness, client segmentation, regulation (including changes in assets holding limits for different types of investors), changes in tax policies, currency convertibility (which may constrain currency conversion, repatriation of profits and/or liquidation of positions), and settlement issues related to local clearing houses are also important risk factors. The sensitivity of fixed-income instruments to macroeconomic shocks may be mitigated by indexing the contracted cash flows to inflation, to FX depreciation, or to specified interest rates – these are common in emerging markets. The index fixings may – by construction – lag or mis-measure the actual move in the underlying variables they are intended to track. The choice of the proper fixing (or metric) is particularly important in swaps markets, where floating coupon rates (i.e., coupons indexed to a typically short-dated interest rate reference index) are exchanged for fixed coupons. Funding in a currency that differs from the currency in which coupons are denominated carries FX risk. Options on swaps (swaptions) the risks typical to options in addition to the risks related to rates movements.

Derivative transactions involve numerous risks including market, counterparty default and illiquidity risk. The appropriateness
of these products for use by investors depends on the investors' own circumstances, including their tax position, their regulatory environment and the nature of their other assets and liabilities; as such, investors should take expert legal and financial advice before entering into any transaction similar to or inspired by the contents of this publication. The risk of loss in futures trading and options, foreign or domestic, can be substantial. As a result of the high degree of leverage obtainable in futures and options trading, losses may be incurred that are greater than the amount of funds initially deposited – up to theoretically unlimited losses. Trading in options involves risk and is not suitable for all investors. Prior to buying or selling an option, investors must review the ‘Characteristics and Risks of Standardized Options’, at http://www.optionsclearing.com/about/publications/character-risks.jsp. If you are unable to access the website, please contact your Deutsche Bank representative for a copy of this important document.

Participants in foreign exchange transactions may incur risks arising from several factors, including the following: (i) exchange rates can be volatile and are subject to large fluctuations; (ii) the value of currencies may be affected by numerous market factors, including world and national economic, political and regulatory events, events in equity and debt markets and changes in interest rates; and (iii) currencies may be subject to devaluation or government-imposed exchange controls, which could affect the value of the currency. Investors in securities such as ADRs, whose values are affected by the currency of an underlying security, effectively assume currency risk.

Unless governing law provides otherwise, all transactions should be executed through the Deutsche Bank entity in the investor’s home jurisdiction. Aside from within this report, important conflict disclosures can also be found at https://research.db.com/Research/ on each company’s research page. Investors are strongly encouraged to review this information before investing.

Please refer to Australia-specific research disclosures and related information at https://australia.db.com/australia/content/research-information.html Where research refers to any particular financial product recipients of the research should consider any product disclosure statement, prospectus or other applicable disclosure document before making any decision about whether to acquire the product. In preparing this report, the primary analyst or an individual who assisted in the preparation of this report has likely been in contact with the company that is the subject of this research for confirmation/clarification of data, facts, statements, permission to use company-sourced material in the report, and/or site-visit attendance. Without prior approval from Research Management, analysts may not
accept from current or potential Banking clients the costs of travel, accommodations, or other expenses incurred by analysts attending site visits, conferences, social events, and the like. Similarly, without prior approval from Research Management and Anti-Bribery and Corruption (“ABC”) team, analysts may not accept perks or other items of value for their personal use from issuers they cover.

Additional information relative to securities, other financial products or issuers discussed in this report is available upon request. This report may not be reproduced, distributed or published without Deutsche Bank’s prior written consent.

Backtested, hypothetical or simulated performance results have inherent limitations. Unlike an actual performance record based on trading actual client portfolios, simulated results are achieved by means of the retroactive application of a backtested model itself designed with the benefit of hindsight. Taking into account historical events the backtesting of performance also differs from actual account performance because an actual investment strategy may be adjusted any time, for any reason, including a response to material, economic or market factors. The backtested performance includes hypothetical results that do not reflect the reinvestment of dividends and other earnings or the deduction of advisory fees, brokerage or other commissions, and any other expenses that a client would have paid or actually paid. No representation is made that any trading strategy or account will or is likely to achieve profits or losses similar to those shown. Alternative modeling techniques or assumptions might produce significantly different results and prove to be more appropriate. Past hypothetical backtest results are neither an indicator nor guarantee of future returns. Actual results will vary, perhaps materially, from the analysis.

The method for computing individual E,S,G and composite ESG scores set forth herein is a novel method developed by the Research department within Deutsche Bank AG, computed using a systematic approach without human intervention. Different data providers, market sectors and geographies approach ESG analysis and incorporate the findings in a variety of ways. As such, the ESG scores referred to herein may differ from equivalent ratings developed and implemented by other ESG data providers in the market and may also differ from equivalent ratings developed and implemented by other divisions within the Deutsche Bank Group. Such ESG scores also differ from other ratings and rankings that have historically been applied in research reports published by Deutsche Bank AG. Further, such ESG scores do not represent a formal or official view of Deutsche Bank AG.

It should be noted that the decision to incorporate ESG factors into any investment strategy may inhibit the ability to participate in certain investment opportunities that otherwise would be consistent with your investment objective and other principal investment strategies. The returns on a portfolio consisting primarily of sustainable investments may be lower or higher than portfolios where ESG factors, exclusions, or other sustainability issues are not considered, and the investment opportunities available to such portfolios may differ. Companies may not necessarily meet high performance standards on all aspects of ESG or sustainable investing issues; there is also no guarantee that any company will meet expectations in connection with corporate responsibility, sustainability, and/or impact performance.
